

User Story: AI Video Search Capability

Problem Description

As an oncologist, medical affairs professional, clinical researcher, or internal oncology team member,

I want to ask clinical questions in natural language and receive concise, evidence-backed answers synthesized from trusted sources such as research papers, clinical guidelines, conference presentations, journal articles, medical websites, and educational videos,

So that I can quickly find relevant oncology information without manually reviewing hundreds of documents.

Description

The system functions as an AI-powered evidence discovery platform for oncology. Users can submit questions such as:

- What are the latest first-line treatment options for metastatic NSCLC with EGFR exon 20 insertion mutations?
- Summarize overall survival outcomes from recent HER2-low breast cancer studies.
- Compare efficacy and safety findings across CAR-T therapies in relapsed lymphoma.
- What evidence supports the use of ctDNA for minimal residual disease monitoring?

The platform searches across approved oncology knowledge sources and generates a synthesized answer while preserving source attribution.

Acceptance Criteria

Natural Language Search

Given a user enters a clinical question, when the search is executed, the system shall return a answer generated from relevant evidence sources.

Source Traceability

Given an answer contains clinical claims, every claim shall be linked to its originating source.

And users shall be able to navigate directly to:

- Research papers
- Clinical guidelines
- Medical websites

- Conference abstracts
- Educational videos

Evidence Quotations

Given a source contributes to an answer, the system shall display the exact supporting material used by the AI and users shall be able to view the surrounding context.

Video Evidence Retrieval

Given relevant information exists within a video, the system shall identify:

- Exact timestamp(s)
- Relevant transcript segment
- Associated slide or visual content when available

And users shall be able to jump directly to the evidence location.

Research Paper Support

Given information originates from a publication, the system shall provide:

- Study title
- Authors
- Publication source
- Publication date
- DOI or reference link
- Relevant extracted findings

Evidence Ranking

Given multiple sources support an answer, the system shall prioritize:

1. Clinical guidelines
2. Peer-reviewed publications
3. Major oncology conference presentations
4. Reputable medical websites
5. Educational video content

Transparency

Given an AI-generated answer, users shall be able to view:

- Sources consulted
- Supporting evidence

Follow-Up Questions

Given a user receives an answer, when they ask a follow-up question, the system shall maintain context and refine the evidence search without requiring the question to be rewritten.

Success Metrics
